INFORMATION FOR CONTRIBUTORS (1994)

Aims and Scope

LEARNING & MEMORY welcomes high-quality original research papers on all types of learning, memory, and their models, conducted in humans and in vertebrate and invertebrate species with the following approaches: behavior, cognition, neuroanatomy, neurophysiology, neuropharmacology, biochemistry, genetics, and cell and molecular biology. The journal will also publish review articles, theoretical papers, and short communications, including comments on published papers and the authors' responses.

Submission of Papers

The journal accepts papers that present original unpublished research. Submission to the journal implies that a paper is not currently being considered for another journal or book. Closely related papers that are in press elsewhere or that have been submitted elsewhere should be included with the submitted manuscript. It is also understood that researchers who submit papers to this journal are prepared to make available to qualified academic researchers the materials needed to duplicate their research results. Authors should submit nucleic acid and protein sequences to the appropriate database. Questions regarding papers should be directed to Judy Cuddihy, Managing Editor, at Cold Spring Harbor Laboratory (516-367-8492).

Manuscripts should be submitted to:
Judy Cuddihy, Managing Editor
Learning & Memory
Cold Spring Harbor Laboratory
1 Bungtown Road
Cold Spring Harbor, New York 11724

Manuscript Preparation

1. General. Papers should be as concise as possible. The entire paper (including tables, figure legends, references, footnotes) should be typed double-spaced on standard-sized European or American bond paper with at least 1-in (2.5 cm) margins on all four sides. Computer printouts should be of letter quality, and should use a computer typeface of at least 11 point size. Each page should be labeled with the first author's name and a page number. Five copies should be submitted; at least four of these copies should have original art. A cover letter should include: (a) name, address, and telephone and FAX numbers of author responsible for correspondence regarding the manuscript; (b) statement that the manuscript has been seen and approved by all listed authors; (c) specific requirements for reproduction of art; and (d) status of any permissions needed. Five copies of the manuscript should be submitted for use by referees and editors.

2. Submitted Papers on Computer Discs. Publication can be speeded up if accepted papers are supplied on 3 1/2- or 5 1/4-inch floppy discs. We can accept IBM PC, Macintosh, or compatible, formats. Please supply the manuscript on the disc as a "text" or ASCII file, if possible. Please indicate on the disc: computer brand name, whether the disc contains a text or word-processing file (name of software), and the disc format. Five hard copy versions should also be submitted for use by referees and editors.

3. Forms. The following order is preferred: Title page, Abstract, Introduction, Methods, Results, Discussion, Acknowledgments, References, Tables, Figure legends. The Title page should include: (a) title; (b) all authors' full names; (c) all affiliations clearly indicated; (d) a shortened version of the title for use as a running head (maximum 45 characters); and (e) key words (up to 6) for use in indexing. The Abstract should be about 200 words long and should summarize the aim of the report, the methodological approach, and the significance of the results. Methods should be detailed enough to allow any qualified researcher to duplicate the results.

4. Figures and Legends. Five sets of figures should be supplied as high-quality glossy prints. Half-tones should be high-contrast, particularly in the case of gels, for the best reproduction. Line drawings, graphs, charts, and chemical formulae, should be professionally prepared and labeled. Multiple-part figures should be submitted as mounted, camera-ready composites. Authors submitting color figures as essential data for review with manuscripts undertake to pay the publication costs of four-color artwork. Price estimates are supplied upon acceptance of the paper.

The back of each figure should be labeled with the first author's name, figure number, and an indication of "top." The figures should be numbered consecutively in the order to which they are referred in the text. The size of the figures will be adjusted to fit the journal format, therefore please try to keep labels, symbols, and other call-out devices in proportion to the figure size detail.

Figure legends should be brief and should not contain methods. Symbols indicated in the figure should be identified in the legend text. If figures are reprinted from another source, permission to reprint is required.

5. Tables. Tabular data should be presented concisely and logically. Tables should be numbered consecutively according to the order cited in the text and each should have a title. Use only horizontal rules and make sure column headings are unambiguous in indicating columns to which they refer. Table legends and footnotes should be included where needed. If tables are reprinted from another source or if data included are from another source, permission to reprint is required.

6. References. References are name/date citations in text; please do not cite by number. Undated citations (unpublished, in preparation, personal communication) should include both initials and last names of authors. Bibliographic information should be supplied in the following order: For Journal articles; Author(s), year, article title, journal title, volume, inclusive page numbers. For books: Author(s), year, chapter title, book title, editors' names, volume, inclusive page numbers, publisher, city of publication.

7. Proofs. Proofs are considered the final form of the paper and correction can be made only in the case of factual errors. If additional information must be added at this stage, it should be in the form of "Note added in proof," subject to the approval of the editors.

8. Reprints. A reprint order form will be included with the proofs.

To help defray the cost of publication, a charge of $25 per page will be made for publication in Learning & Memory. Authors unable to meet these charges should include a letter of explanation upon acceptance for publication; inability to meet these charges will have no effect on acceptance and publication of submitted papers.
MOLECULAR CLONING A LABORATORY MANUAL, SECOND EDITION

J. Sambrook, University of Texas Southwestern Medical Center; E.F. Fritsch, Genetics Institute; T. Maniatis, Harvard University

"The [second edition] of Molecular Cloning is indeed an impressive achievement. Its growth in size alone bears witness to the explosion in molecular techniques... This expansion reflects more comprehensive coverage of topics previously included in the first edition as well as the addition of new chapters, such as those on oligonucleotide probes and mutagenesis, in vitro amplification by the polymerase chain reaction, expression of cloned genes in Escherichia coli and mammalian cells, and analysis of proteins expressed from cloned genes. Particularly noteworthy are the sections dealing with construction of complementary DNA and genomic libraries. Current tendencies to 'clone by kit' and 'clone by phone' aside, these sections provide thoughtful accounts of different approaches with a balanced view of their inherent strengths and weaknesses. As with the previous edition, the protocols are presented in a pleasing, easy-to-read format.... Molecular Cloning is of truly exceptional value. By virtue of its heritage and modest cost, it is likely to be more widely used by students at all stages of development."-Nature

A SHORT COURSE IN BACTERIAL GENETICS
A Laboratory Manual and Handbook for Escherichia coli and Related Bacteria
Jeffrey H. Miller, University of California, Los Angeles

A long-awaited sequel to Experiments in Molecular Genetics, the two-part volume A Short Course in Bacterial Genetics: A Laboratory Manual and Handbook for Escherichia coli and Related Bacteria is essential for all those doing genetic or recombinant DNA work with E. coli or similar organisms. The Manual includes 34 detailed experiments with step-by-step protocols and easy-to-follow diagrams that demonstrate major concepts in experimental bacterial genetics. The experiments cover the essential points of mutagenesis, gene transfer, transposable elements, and gene fusions and are accomplished with a set of 44 bacterial strains. The strains are prepared in the author's laboratory and sold by Cold Spring Harbor Laboratory Press as a kit.

The Handbook summarizes important information about E. coli, its genes and proteins, phage and plasmid vectors, transposable elements (including relevant sequence information), the current detailed genetic map, and the complete restriction maps of several cosmid and plasmid libraries of the entire genome.

1992, 876 pp., illus., color plates, bibliography, index ISBN 0-87969-349-5
Plastic comb bound Manual and Paperback Handbook $110

A Short Course in Bacterial Genetics Strain Kit. A kit of 44 bacterial strains and phage lysates is available through Cold Spring Harbor Laboratory Press. Prepared and tested in the author's laboratory at UCLA, the strains are used in the set of experiments described in A Short Course in Bacterial Genetics and are valuable for many additional experiments. (Please give your phone number when ordering and allow 6 weeks for delivery).

$350 ISBN 0-87969-400-9

ANTIBODIES A LABORATORY MANUAL

Ed Harlow, Cold Spring Harbor Laboratory; David Lane, Imperial Cancer Research Fund Laboratories

Antibodies aims "to put current immunological methodology into the hands of non-specialists. Happily, Harlow and Lane have succeeded admirably and this manual seems certain also to gain a place on the laboratory bench (too useful to remain on the bookshelf) of a wide variety of biologists-even immunologists. The volume opens with four introductory chapters summarizing key features of the immune response; these provide a succinct overview of the field and are very well written. The scope of the rest of the book includes techniques of immunization and bleeding, monoclonal antibodies and hybridomas, protein labelling, immunoassays (mostly those using solid supports), immunoprecipitation of cellular antigens, immunoblotting and immunofluorescence purification... The methods are presented as easy-to-follow '1-2-3 protocols,' and assume relatively little experience. Rationales for procedures are often presented, which helps to remove some of the mystique that has been associated with immunological methodology."

Our newest lifesaver, the PDMI-2 is a revolution in micro-incubation. It's the first to control heating or cooling of the perfusion fluid using Peltier devices. The PDMI-2's unique capabilities are guaranteed to change the way cellular microscopy is performed.

We at Medical Systems Corp. are the micro-incubation people - The perfect resource for all your needs. Options include • heating/cooling chambers • open or closed perfusion chambers • reusable Cover Slip Dish for high magnification, oil immersion, phase/interference contrast, and fluorescence • gas and pH capabilities • unique aspirator • Tissue Slice Chamber: interface/submerged • pre-slice chamber • temperature controllers.

For more information call 800 654-5406 or write Medical Systems Corp., One Plaza Rd., Greenvale, NY 11548 516 621-9190, FAX 621-8503.
