Correcting the Blueprint of Life
An Historical Account of the Discovery of DNA Repair Mechanisms

By Errol C. Friedberg, The University of Texas Southwestern Medical Center, Dallas

In this brief, readable, and revealing book, one of the pioneers of the now rapidly evolving field of DNA repair traces the history of the discovery of the more important mechanisms by which cells respond to DNA damage. Errol Friedberg has written an enjoyable and informative introduction to the study of DNA mutagenesis and repair that will interest students at an advanced undergraduate or graduate student level as well as investigators in fields as diverse as oncogenesis, cell cycle regulation, transcription and DNA replication.

1997, 224 pp., illus., index
Cloth $49

CONTENTS
CHAPTER 1: In the Beginning
CHAPTER 2: Let There Be Light: The Discovery of Enzymatic Photoreactivation
CHAPTER 3: The Emergence of Excision Repair
CHAPTER 4: New Mechanisms for Repairing DNA
CHAPTER 5: Mismatched Bases Are Repaired by Yet a Different Mode
CHAPTER 6: The Remarkable SOS Phenomenon
CHAPTER 7: Epilogue: Molecule of the Year 1994
Notes

Participants at the first formal conference on DNA repair (1965).
